Anastasia Zamaraeva

Manifesto

It seems to me that nothing has meaning; yet there is nothing we cannot give meaning to.

I am ready to defend my beliefs fiercely, but that does not mean I am unwilling to change my mind.

It seems to me that there is no absolute truth; and so there is no single, definitive answer to any question. But that does not mean we should stop asking questions. On the contrary, we should ask more questions, to find more different answers and new questions.

If I look at a drawing of a cube on an ordinary sheet of paper, I can say it is a cube. And I would be right. But that contradicts the definition of a cube, which is a three-dimensional figure. Yet the drawing on paper is not two-dimensional either, because we exist in a three-dimensional reality. But even with this three-dimensionality, it is still not a cube by the geometric definition. And yet I clearly see a cube in the drawing, its conventional representation.

It seems to me that everything in the world is a convention; this lets us find more answers to a single question than we set out to find.

I want to ask more questions and look for more answers.

I am not questioning science in the traditional sense; I believe in science. But I think it is possible to believe in one thing and look for another. This is not a contradiction.

Throughout history, science has more than once disproved what it had previously established. That is normal.

A question is what drives humanity forward; an answer is a moment's rest along the way.

We do not know where we come from or where we are going, and I do not know whether we will find the answers. So perhaps we should keep moving.

Or maybe not,
and that is another question
