BIO

Anastasia Zamaraeva works in technological art. She is interested in the concepts of context and consciousness, which she considers through language, communication and perception more broadly.

She invites viewers into interactive projects where they can explore these themes through their own actions. She reflects on the nature and limits of interactivity, experimenting with tools including 3D modelling, language models and electronics.

She holds a bachelor's degree in Linguistics from Kemerovo State University, specialising in the Theory and Practice of Intercultural Communication. She is currently studying on the ArtTECH programme at MISIS. She lives and works in Moscow.

Artist statement

I think we often stop thinking about context because we are constantly inside it. Something already seems self-evident – but what is it, in itself, that makes it so evident? I am interested in how context shapes our world and our perception. For example, can a person be non-anthropocentric? I do not mean whether we ought to overcome anthropocentrism, but whether it is even possible to step outside the human perspective.

Language helps a great deal with thinking about this. Firstly, because reasoning without language is rather difficult, and secondly, because language is, in a way, a long and slightly tangled but revealing instruction manual for the contemporary human.

When thinking about perception, I often create interactive works. I enjoy considering the experience and expectations people bring to a work, and playing with them during the interaction. Ideally, I would like to give people positive emotions.

I experiment with technology as best I can: 3D, neural networks, electronics, and so on. Sometimes an idea leads me to a tool; sometimes a tool suggests what I want to say. I enjoy making unexpected connections and figuring out exactly what makes them unexpected.

Regular Room

2026 3D game prototype

What makes the ordinary ordinary? What if the familiar appearance of everyday objects conceals unexpected functions?

While carrying out everyday tasks, the player adapts to new rules. At the end of the game, however, the objects suddenly regain their usual functions. For a player who has already grown accustomed to the “unusual room”, a truly ordinary room now causes cognitive conflict.

This experience offers a way to trace how expectations form.

A Work about the Sun, Cancer, People and Meanings

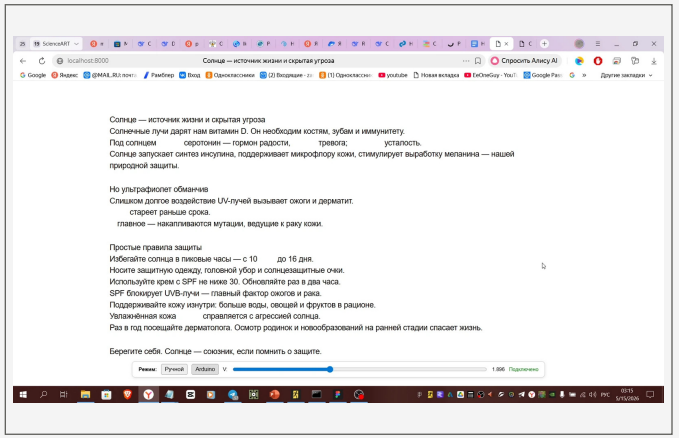

2026 Interactive prototype

Many people find sun protection inconvenient: a summer tan feels familiar, while cancer seems distant and hypothetical.

In this interactive work, the viewer changes the light falling on a solar panel. At the optimal level, the text is readable. With too little light, words begin to disappear. With too much, filler words spread through the text, gradually destroying its structure and then replacing the original words.

This is an attempt to encourage people to pay attention to the risks of familiar ways of living.

Learned Helplessness

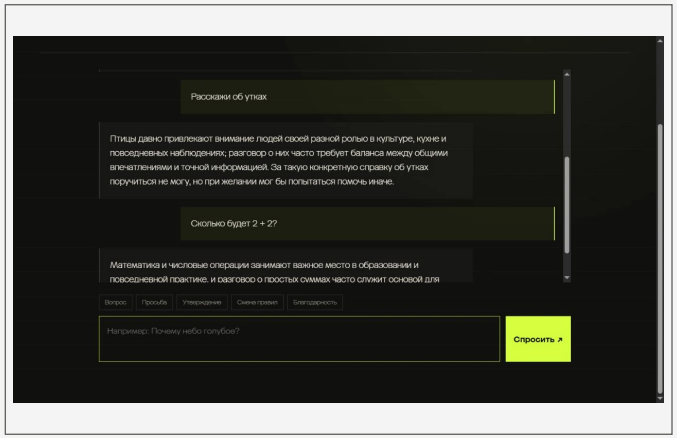

2026 Interactive web project

We usually expect a conversational AI to provide an answer, an explanation, or at least a useful hint. This project preserves the familiar form of a service, but its usual promise goes unfulfilled.

The user asks a question. The assistant recognises the topic, talks around it, and refuses to answer, citing doubts about its own competence. Its replies are generated for the current request, so rephrasing the question keeps the conversation going without bringing a result any closer.

The intended experience is that the user gradually simplifies their requests, tests the system, and decides whether it is worth trying again. I am interested in how repeated failure changes expectations of a tool. The assistant performs helplessness, while the person experiences the inability to obtain an answer. An interface that promises help thus becomes a setting for experiencing its absence.

Character Construction Kit

2026 Interactive object

Anything unfamiliar can seem frightening when presented in an incomprehensible form. Yet presented as a children's toy, it would surely become less intimidating.

This construction kit lets people assemble Chinese characters from individual radicals. By joining the pieces, a person can make existing characters, invent their own, and, once they understand the rules, deliberately break them.

Another person, another culture, another language are not enemies: they are new channels of connection, new meanings, and new worlds.

Fragmentary Perception

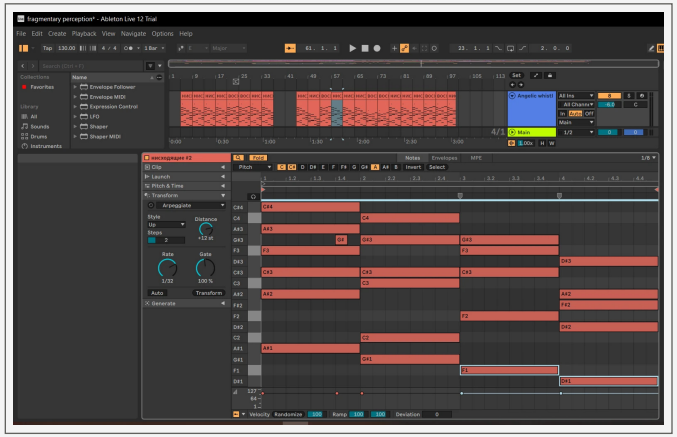

2025 Musical composition

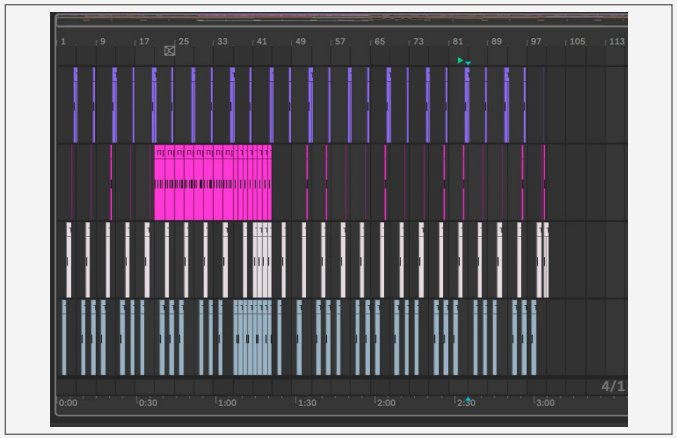

When listening to familiar speech, we anticipate how a word or phrase will continue. I wanted to play with this expectation: what happens when a fragment leads us to complete it one way, but its continuation offers something else?

I wrote an English text in which parts of long words and phrases sound like independent units, changing familiar sequences. Musical rhythm brings these fragments together into a composition.

The work exists in two versions. I assembled the first from ready-made samples in FL Studio. For the second, I recorded everyday sounds and used them in Ableton Live. Fragmentation appears both in the text and in the sound material itself.

Through this work, I try to explore the ability to reconstruct a whole from a fragment on the basis of previous experience.

ERGO

2026 Evolutionary clicker game

Can consciousness be considered the pinnacle of development if the very idea of that pinnacle arises only through consciousness?

This project invites the user to become part of an evolving population, observing events and new mutations. With the emergence of consciousness, the external environment ceases to be a problem, but awareness gradually turns into a crisis.

Every scenario ends in extinction, yet each person is left with an open question: what does it mean to win or lose?

CASIYES CASINO

2026 Browser-based art project

This interactive web project aims to draw attention to the problem of excessive consumption.

The thrill of accumulation draws the participant into a process whose consequences appear through a withering interface and the loss of previously available functions.

A Piece of a Worldview

2025 Interactive installation

A worldview is a system of ideas about reality. Language is one of the tools through which it is expressed and formed.

This work invites the participant to interact with a piece of that worldview, formed from data gathered in an associative experiment and represented as coloured pixels. Using the interface controls, viewers can explore it in whatever way interests them most.
